

CADMATIC Hull

Release
highlights

2015Q4

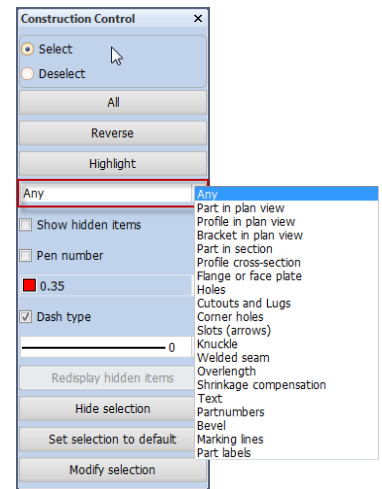

These release highlights contain items included in the 2015Q4 release, for information about previous versions – refer to the respective highlights. More details about the new functionalities can be found in the release notes. Note that CADMATIC Hull 2015Q4 is only fully compatible with CADMATIC Outfitting 2015Q3 and higher versions.

Speed improvement

The Hull Structure module has been significantly improved, which speeds up the process that is needed for updating the construction itself by 25% for an active block and 10% for all blocks. This obviously saves time for every user in the block or project.

Presentation Filters

The “Construction Control” function now allows the user to select more types of construction items to hide or modify the default presentation of the selected items in the current drawing. With this extended possibility the drawing can be edited to your own liking.

Export to DXF/DWG

The set of possibilities for influencing the export of CADMATIC Hull drawings to DXF / DWG format has been extended. It gives you the opportunity to activate a user-defined macro, which allows you to carry out additional actions before the DXF / DWG file is created.

Pillar-profiles

Straight and bent profiles can now also be placed at construction of a neighboring (dashed) block, which results in a pillar-profile. Pillar-profiles are both the profile that is created in the neighboring block, as well as the pillar that is thereby created in the current block. One of the advantages of the pillar profile is that it is part of the current block. This means you don’t have to switch to another block or ask your colleague to place the profile, but can do it yourself, which simplifies the process. Also, all functions to modify profiles can be used for pillar-profiles.
